

## Hexia - Case Study

“If we’d refused to purchase XpoLog our CTO would have resigned...”

### Summary

Hexia.net provides a fully featured mobile service for operators, media companies, enterprises, institutions and individuals. Featuring content delivery through MMS, SMS, WAP Portal pages and WAP Push, user driven content through Mobile Web logs, Hexia.net offers unprecedented flexibility in deployment of value added services

### The Challenge

As the distributed architecture of the service platform is needed for scalability and redundancy, it is difficult to provide Network Operations and Development teams with synchronized views of logs, e.g. following a request from a web application to the application server and from the application server to the billing interfaces and MMS message handlers for each operator

### The Solution

XpoLog is providing a management and analysis station for the logs on the distributed architecture of Hexia’s service platform. XpoLog is creating a synchronized view on the entire picture, giving Hexia’s teams the entire story at a glance

### The business benefits

XpoLog is used by the development team as well as the system operations team to get a synchronized view of the health of the Hexia.net clusters. XpoLog has proven its worth many times over, saving a lot of time in development and operations, especially through the merged logs from many different servers feature
