

## Traiana - Case Study

“XPLG provides the best log monitoring solution over the web”

### Summary

Traiana, Inc. provides global banks and broker/dealers with enterprise solutions that streamline operations, lower costs and improve client service through Trading Relationship Management (TRM). Traiana TRM solutions combine the integration of counter parties, automation of trade processes and management of trading relationships to lower costs, retain clients and eliminate operational risk in institutional trading

### The Challenge

Supporting many real time applications with a huge amount of logs makes it hard to monitor and catch the crucial exceptions before the problems occur. As result in most cases we are aware of problems only after they are already affecting the customer's applications.

Also, we find it very difficult to track and analyze the logs of separate solutions which are hosted on different servers

### The Solution

XpoLog provides a wide range of capabilities to analyze our log files. XpoLog Center is monitoring our logs constantly and sends an immediate report when a desired event is revealed. Further more, when an error is discovered, XpoLog, along with the Search Engine gives us the ability to immediately drill down into the data from dozens of rotating log files and get a high and instant resolution on the problems

### The business benefits

In production environments which hold several real time applications, XPLG provides real time information about any problem that might affect our customers and also quick proactive solution before the customers are facing the actual problem.

Also, XPLG provides us centralized log analysis information for separate solutions which are hosted on different servers over the web
